5G FOR BEGINNERS

WHAT NEEDS TO SAID

5G Deployment Near Residences

I live in a forested area in Grand Bend Ontario that has about 500 homes interspersed with oak and tall pine. For many years, we residents shared a single receiving tower for TV signals that was linked to the residences. The receiving station was located close to a dozen or more residences within 500 yards distance. In a very great hurry Bell, acquired an agreement with an associative body appointed to represent the residences, but neither that body nor the residences were informed until the agreement was signed and cash flows to the association were agreed.

So I have a residence within 500 yards of a 4G/LTE capable cell tower. Those that could move did move and they had inside information. I cannot sleep in my main bedroom of a two story home because the EMF field radiation is so high that I get stressed out. My health is normally A plus. We moved to another bedroom, less radiated. We turn off wifi every night before sleeping. Our property value dropped and we got into a lower tax bracket. We have no idea what the long term cancer risk is because no one knows, or if they do, they don't say.

Our area is now serviced by very high speed fibre optics to residences. The EMF cell tower is very redundant and we can receive all we need through internet on fibre optics. The

new or any 5G Bell service is going to be a waste of valuable resources because of massive duplication. We don't need it because we have fibre optics and the internet via fibre optics.

I suspect that we will be pressured to have wireless 5G near our residences whether this is a risk to health or not.

Its obvious to a six year old that 3G wireless is here to stay, but my six year olds will be better off without 5G running 24/7. They have fibre optics for the heavy duty stuff until honest research tells us wireless has no risks. I cringe every time a male friend puts a live cell phone in his trousers pocket within Six inches of vital organs such as the pancreas. So was Steven Jobs a victim of his invention. We may never know, but the association is there for six year olds to draw preliminary conclusions.
